

Multi-Mission Service

The KSAT multi-mission service uses the most extensive virtual constellation of satellites to provide imagery from anywhere on the globe in Near Real-Time.

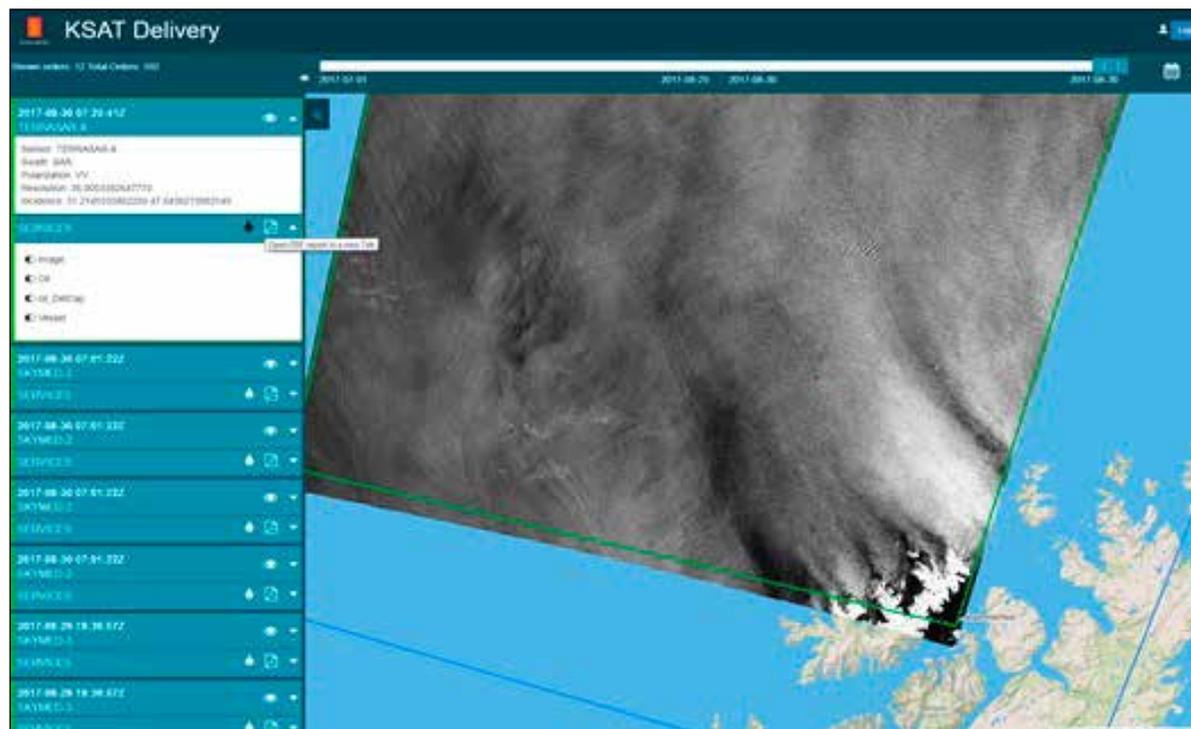

By leveraging its unique global ground network KSAT can deliver updated satellite imagery and derived products to customers very shortly after acquisition. KSAT is supplementing SAR imagery with data from medium- and high-resolution optical satellites.

Our service chain is end-to-end, with every link executed in-house. This includes satellite planning across all possible options, data acquisition and processing using the world's most extensive, and best-positioned, antenna network, and finally, expert interpretation of the imagery.

The highly qualified KSAT image analysts operate on a 24/7/365 basis, and are always ready to respond to customer requests. Our unparalleled multi-mission, Near Real-Time offerings provide our customers with actionable information. This applies equally to petroleum companies, defence and intelligence agencies, other governmental and non-governmental organizations, or any other end-user who require accurate and timely information.

KSAT's virtual constellation ensures that our customer's requirements with regards to coverage, resolution, monitoring frequency and access to archives and new collections are optimally met.

In addition to providing imagery, KSAT provides a variety of services and products derived from satellite data including our industry leading oil spill, vessel and ice detection services. The Multi-Mission service is therefore the very backbone of our Near Real-Time maritime monitoring.

Mission Planning and Order Desk

The KSAT Orderdesk is staffed by personnel with extensive expertise in all aspects of satellite planning and imagery acquisition. This is coupled with an industry-leading planning tool, SavoirK, which enables them to see the entire range of possibilities available to meet the customer's requirement in terms of resolution, frequency and price of the imagery required.

In addition, the Orderdesk has extensive relationships with their counter-parts at every satellite operator in KSAT's virtual constellation. They therefore handle all administration aspects of the planning, ordering and delivery system on the customer's behalf.

The KSAT Orderdesk is therefore the customer's single point of contact for feasibility studies, acquisition planning, the actual order of imagery and all communication with the individual satellite owners.
